ABSTRACT

An object of the present invention is to provide a polyolefin resin composition with excellent transparency, which is obtained by a method which is economically advantageous, and easily produces said composition, wherein said composition hardly generates white spots thought to be an insoluble part of a diacetal compound, while retaining the intact transparency imparted by the diacetal. A clarifier for polyolefin resins which comprises a combination of an acetal compound represented by the general formula (1) with a specific amount of a modifier represented by the general formula (2) or (3) is used. Thus, white spots thought to be an insoluble part of the diacetal compound can be significantly diminished.

$$(R^1-SO_2NHCO-Q)_n-R^2$$
